This is a digital copy of a book that was preserved for generations on library shelves before it was carefully scanned by Google as part of a project to make the world's books discoverable online.

It has survived long enough for the copyright to expire and the book to enter the public domain. A public domain book is one that was never subject to copyright or whose legal copyright term has expired. Whether a book is in the public domain may vary country to country. Public domain books are our gateways to the past, representing a wealth of history, culture and knowledge that's often difficult to discover.

Marks, notations and other marginalia present in the original volume will appear in this file - a reminder of this book's long journey from the publisher to a library and finally to you.

Usage guidelines

Google is proud to partner with libraries to digitize public domain materials and make them widely accessible. Public domain books belong to the public and we are merely their custodians. Nevertheless, this work is expensive, so in order to keep providing this resource, we have taken steps to prevent abuse by commercial parties, including placing technical restrictions on automated querying.

We also ask that you:

+ *Make non-commercial use of the files* We designed Google Book Search for use by individuals, and we request that you use these files for personal, non-commercial purposes.

+ *Refrain from automated querying* Do not send automated queries of any sort to Google's system: If you are conducting research on machine translation, optical character recognition or other areas where access to a large amount of text is helpful, please contact us. We encourage the use of public domain materials for these purposes and may be able to help.

+ *Maintain attribution* The Google "watermark" you see on each file is essential for informing people about this project and helping them find additional materials through Google Book Search. Please do not remove it.

+ *Keep it legal* Whatever your use, remember that you are responsible for ensuring that what you are doing is legal. Do not assume that just because we believe a book is in the public domain for users in the United States, that the work is also in the public domain for users in other countries. Whether a book is still in copyright varies from country to country, and we can't offer guidance on whether any specific use of any specific book is allowed. Please do not assume that a book's appearance in Google Book Search means it can be used in any manner anywhere in the world. Copyright infringement liability can be quite severe.

About Google Book Search

Google's mission is to organize the world's information and to make it universally accessible and useful. Google Book Search helps readers discover the world's books while helping authors and publishers reach new audiences. You can search through the full text of this book on the web at `http://books.google.com/`

Über dieses Buch

Dies ist ein digitales Exemplar eines Buches, das seit Generationen in den Regalen der Bibliotheken aufbewahrt wurde, bevor es von Google im Rahmen eines Projekts, mit dem die Bücher dieser Welt online verfügbar gemacht werden sollen, sorgfältig gescannt wurde.

Das Buch hat das Urheberrecht überdauert und kann nun öffentlich zugänglich gemacht werden. Ein öffentlich zugängliches Buch ist ein Buch, das niemals Urheberrechten unterlag oder bei dem die Schutzfrist des Urheberrechts abgelaufen ist. Ob ein Buch öffentlich zugänglich ist, kann von Land zu Land unterschiedlich sein. Öffentlich zugängliche Bücher sind unser Tor zur Vergangenheit und stellen ein geschichtliches, kulturelles und wissenschaftliches Vermögen dar, das häufig nur schwierig zu entdecken ist.

Gebrauchsspuren, Anmerkungen und andere Randbemerkungen, die im Originalband enthalten sind, finden sich auch in dieser Datei – eine Erinnerung an die lange Reise, die das Buch vom Verleger zu einer Bibliothek und weiter zu Ihnen hinter sich gebracht hat.

Nutzungsrichtlinien

Google ist stolz, mit Bibliotheken in partnerschaftlicher Zusammenarbeit öffentlich zugängliches Material zu digitalisieren und einer breiten Masse zugänglich zu machen. Öffentlich zugängliche Bücher gehören der Öffentlichkeit, und wir sind nur ihre Hüter. Nichtsdestotrotz ist diese Arbeit kostspielig. Um diese Ressource weiterhin zur Verfügung stellen zu können, haben wir Schritte unternommen, um den Missbrauch durch kommerzielle Parteien zu verhindern. Dazu gehören technische Einschränkungen für automatisierte Abfragen.

Wir bitten Sie um Einhaltung folgender Richtlinien:

+ *Nutzung der Dateien zu nichtkommerziellen Zwecken* Wir haben Google Buchsuche für Endanwender konzipiert und möchten, dass Sie diese Dateien nur für persönliche, nichtkommerzielle Zwecke verwenden.

+ *Keine automatisierten Abfragen* Senden Sie keine automatisierten Abfragen irgendwelcher Art an das Google-System. Wenn Sie Recherchen über maschinelle Übersetzung, optische Zeichenerkennung oder andere Bereiche durchführen, in denen der Zugang zu Text in großen Mengen nützlich ist, wenden Sie sich bitte an uns. Wir fördern die Nutzung des öffentlich zugänglichen Materials für diese Zwecke und können Ihnen unter Umständen helfen.

+ *Beibehaltung von Google-Markenelementen* Das "Wasserzeichen" von Google, das Sie in jeder Datei finden, ist wichtig zur Information über dieses Projekt und hilft den Anwendern weiteres Material über Google Buchsuche zu finden. Bitte entfernen Sie das Wasserzeichen nicht.

+ *Bewegen Sie sich innerhalb der Legalität* Unabhängig von Ihrem Verwendungszweck müssen Sie sich Ihrer Verantwortung bewusst sein, sicherzustellen, dass Ihre Nutzung legal ist. Gehen Sie nicht davon aus, dass ein Buch, das nach unserem Dafürhalten für Nutzer in den USA öffentlich zugänglich ist, auch für Nutzer in anderen Ländern öffentlich zugänglich ist. Ob ein Buch noch dem Urheberrecht unterliegt, ist von Land zu Land verschieden. Wir können keine Beratung leisten, ob eine bestimmte Nutzung eines bestimmten Buches gesetzlich zulässig ist. Gehen Sie nicht davon aus, dass das Erscheinen eines Buchs in Google Buchsuche bedeutet, dass es in jeder Form und überall auf der Welt verwendet werden kann. Eine Urheberrechtsverletzung kann schwerwiegende Folgen haben.

Über Google Buchsuche

Das Ziel von Google besteht darin, die weltweiten Informationen zu organisieren und allgemein nutzbar und zugänglich zu machen. Google Buchsuche hilft Lesern dabei, die Bücher dieser Welt zu entdecken, und unterstützt Autoren und Verleger dabei, neue Zielgruppen zu erreichen. Den gesamten Buchtext können Sie im Internet unter `http://books.google.com` durchsuchen.

	Cos.	d.	Cot.	d. c.	Tang.	Sin.		P. P.

Für kleine Winkel ist: log Bogen in Graden = log Sinus + S (siehe Pag. 170).
= log Tang + T
log Sinus = log Bogen − S
log Tang = log Bogen − T

Logarithmen

zur

Berechnung der Summen und Differenzen von Zahlen, deren Logarithmen gegeben sind.

Gegeben: log a und log b, wo a > b, so ist bis A = 10

für Summen	für Differenzen
wenn $10 + \log b - \log a = A$	wenn $\log a - \log b = B$
$\log (a+b) = \log a + B.$	$\log (a-b) = \log b + A - 10.$

Additions- und Subtraktions-Logarithmen.

Hier ist, wenn $a > b$

für Summen

wenn $\log a - \log b = A$
$\log (a+b) = \log b + B$

für Differenzen

wenn $\log a - \log b = B$
$\log (a-b) = \log b + A$.

Subtraktions-Logarithmen,

wenn die Differenz der gegebenen Logarithmen grösser als 0,42000 ist.

Formel.

Gegeben: log a und log b, wo log a > log b, so ist, wenn $\log a - \log b = B$ gesetzt wird,
$\log (a-b) = \log a + C - 10$.

Gebrauchs-Anweisung.

Es seien b,b′ die beobachteten Barometerstände, in beliebigem Mafse,
„ „ t,t′ Temperatur der Luft, Réaumur,
„ „ T,T′ „ des Quecksilbers.

„ Von log b und log b′ werden 10 T und 10 T′ (in Einheiten der 5ten Decimale) abgezogen, und bilde man u = log b — 10 T — (log b′ — 10 T′).

Dann ist log h (Höhe in Metern) = log u + A, wozu noch die Correctionen wegen Polhöhe und wegen Höhe h hinzukommen.

Beispiel. Höhe des Pic de Bigore über Tarbes, Breite = 43°

b = 27.17 Zoll	T = 14.9 R.	t = 15.3 R.	lg b	1.43409	— 149
b′ = 19.845 „	T′ = 7.6	t′ = 3.2	lg b′	1.29765	— 76
			u	0.13571

			lg h	3.41669	
			Polh. (43)	+ 9	
			lg h (3.4)	+ 17	
			h = 2612 Meter	lg 3.41695	

In der Chronologie kommen drei Zeitkreise oder Cyclus zur Anwendung, nämlich:

1) Der Sonnencyclus von 28 Jahren, nach dessen Ablauf die Sonntage wieder auf denselben Jahrestag zurückkehren;
2) der Mondcyclus von 19 Jahren, welcher nahe 235 Mondumläufen gleichkommt, und
3) der Indiktionscyclus von 15 Jahren, von den späteren römischen Kaisern eingeführt.

Auf diese drei Zeitkreise gründet sich die julianische Periode von 28.19.15 = 7980 Jahren. Das Jahr 1 der julianischen Periode ist das Jahr 4713 vor Christi Geburt, und man findet daher das Jahr der julianischen Periode, wenn man das Jahr vor Chr. Geb. von 4714 subtrahiert, und nach Chr. Geb., wenn die Jahreszahl zu 4713 addiert wird.

Die Geburt Christi wird auf den 25. December desjenigen Jahres gesetzt, welches dem Jahr 1 unserer heutigen Jahresrechnung vorangeht. Das Jahr 1 vor Chr. Geb. ist dasjenige, in welches die Geburt Christi selbst fällt, von wo anfangend beliebig weit rückwärts gezählt wird. Auf das Jahr 1 v. Chr. folgt unmittelbar das Jahr 1 n. Chr.

Die julianischen Jahre werden zu $365^1/_4$ Tagen gerechnet. Es folgen regelmäfsig auf einander drei Gemeinjahre zu 365 Tagen und ein Schaltjahr zu 366 Tagen. Das Jahr 1 der julianischen Periode war ein Schaltjahr, und so sind alle Jahre derselben, welche durch 4 dividiert den Rest 1 geben, Schaltjahre. Von der Jahreszahl ausgehend sind die Jahre v. Chr. Schaltjahre, welche durch 4 dividiert den Rest 1 geben, und n. Chr., welche keinen Rest geben.

Sonnencirkel ist der Rest, welcher sich ergibt, wenn das Jahr der julianischen Periode durch 28 dividiert wird.

Güldene Zahl ist der Rest der Division durch 19.

Römerzinszahl ist der Rest der Division durch 15.

Ist von einem Jahre A der julianischen Periode der Sonnencirkel = a, die güldene Zahl = b und die Römerzinszahl = c, so hat man die Gleichung

$$A = 4845 . a + 4200 . b + 6916 . c - 7980 . n,$$

wo n so grofs zu nehmen ist, bis der übrig bleibende Rest kleiner als 7980 ist.

Für die Jahre nach Christi Geburt hat man auch

Sonnencirkel = Rest: Jahreszahl + 9, dividiert durch 28,
güldene Zahl = Rest: Jahreszahl + 1, dividiert durch 19,
Römerzinszahl = Rest: Jahreszahl + 3, dividiert durch 15.

Das julianische Jahr ist um 11 Minuten 12 Sekunden länger als das wirkliche Sonnenjahr, von einer Frühlingsnachtgleiche zur andern gerechnet, wodurch im julianischen Kalender die Frühlingsnachtgleiche, die zur Zeit des ersten Concils zu Nicäa auf den 21. März fiel, im 16. Jahrhundert um 10 Tage früher eintraf. Diese Abweichung gegen das wirkliche Sonnenjahr wurde durch den von Papst Gregor XIII. im Jahr 1582 eingeführten gregorianischen Kalender ausgeglichen, wonach auf den 4. Oktober dieses Jahres, einem Donnerstag, der 15. Oktober auf den folgenden Freitag angesetzt war. Nach diesem jetzt in der ganzen Christenheit, mit Ausnahme der griechischen Kirche, eingeführten gregorianischen Kalender werden in 4 Jahrhunderten 3 Schalttage ausgelassen. Die Jahre 1600, 2000, 2400 etc. sind Schaltjahre, wogegen 1700, 1800, 1900 und alle nicht durch 4 teilbare Jahrhunderte Gemeinjahre sind. Im übrigen ist jedes Jahr, wenn die Jahreszahl durch 4 teilbar ist, ein Schaltjahr.

Das Osterfest, wonach die beweglichen Feste sich richten, wird den ersten Sonntag nach dem Frühlingsvollmond gefeiert. Fällt dieser selbst auf einen Sonntag, so ist Ostern am nächsten Sonntage. Der Frühlingsvollmond ist derjenige, welcher nach cyclischer Rechnung auf den 21. März, oder zunächst nach diesem Tage eintrifft. Hiernach kann Ostern auf den 22. März, als frühesten Termin, und auf den 25. April, als spätesten Termin, fallen.

Julianische Jahre vor Christi Geburt.

Das Datum der Sonntage ist = l + m + n ± 7.t.

Bemerkungen zu vorstehenden Tafeln.

1) Das Datum der Sonntage in einem beliebigen Jahre vor oder nach Chr. Geb. erhält man, wenn die Zahlen l, m und n zu einander addiert werden. Ist diese Zahl gröfser als 7, so ist der erste Sonntag des betreffenden Monats 7 Tage früher. Die Zahl l entspricht dem vollen Jahrhundert. Die Zahl m erhält man aus dem entsprechenden Täfelchen, da wo die Horizontale für die Zehner der Jahreszahl mit der Vertikalen für die Einer zusammentrifft. Die Zahl n gilt für den betreffenden Monat.
2) Die Zahl l ist für die Jahrhunderte 1500—2100 n. Chr. doppelt angegeben. Hier gilt die erste Zahl für den julianischen, die zweite für den gregorianischen Kalender.
3) Die Zahl n ist für die Monate Januar und Februar ebenfalls doppelt angegeben. Hier gilt die erste für ein Gemeinjahr, die zweite für ein Schaltjahr.
4) Das Osterfest ist in den ersten Jahrhunderten der christlichen Zeitrechnung nicht überall an demselben Tage gefeiert worden. Erst vom sechsten oder siebenten Jahrhundert an läfst sich annehmen, dafs die jetzt noch in der griechischen Kirche bestehende Rechnungsweise eine für die ganze Christenheit allgemeine war. Hiernach fällt Ostern auf den ersten Sonntag nach dem Frühlings-Vollmond, und wenn dieser selbst auf einen Sonntag fällt, auf den nächstfolgenden Sonntag. Diese Regel gilt auch für den gregorianischen Kalender.
5) Der Frühlings-Vollmond, von der güldenen Zahl abhängend, ist in der ersten Tabelle für den julianischen Kalender angegeben. Für den gregorianischen Kalender verändert sich diese Tabelle, je nach dem Werte der Epakte im ersten Jahre des Mondcyclus, und es sind von den 30 möglichen Tabellen hier die 3 bis zum Jahr 2200 reichenden angegeben.

Beispiel 1. Auf welchen Wochentag fällt der 24. Mai 2357 v. Chr.?
Nach obiger Tafel ist für 2300 . . . l = 7
„ 57 . . . m = 1
„ Mai . . . n = 6
daher l + m + n . . . = 14
Die Sonntage im Mai sind daher den 7., 14., 21., 28.; daher der 24. ein Mittwoch.

Beispiel 2. Auf welchen Wochentag fällt der 24. Januar 1712, der Geburtstag Friedrichs des Grofsen?
Hier ist nach dem greg. Kal. zu rechnen, daher
für 1700 . . . l = 3
„ 12 . . . m = 6
und da 1712 ein Schaltjahr, Januar . . . n = 1
l + m + n = 10
daher der 24. Januar = 10 + 2 . 7 ein Sonntag.

Beispiel 3. Wann ist Ostern im Jahr 742?
Die güldene Zahl ist = Rest 742 + 1 : 19 = 2, daher der Frühlings-Vollmond den 25. März. Ferner ist l + m + n für März = 11, daher der 11., 18., 25. Sonntage. Ostern fällt daher auf den 1. April.

Beispiel 4. Ostern für das Jahr 1872 zu berechnen.
Die güldene Zahl ist = Rest 1873 : 19 = 11,
daher im jul. Kal. der Frühl.-Vollmond 15. April.
l + m + n (April) findet sich = 9, also Ostern 16. April.
Im greg. Kal. ist der Frühl.-Vollmond 24. März.
l + m + n (März) findet sich = 10, also 10., 17., 24., 31. Sonntage. Ostern ist daher den 31. März.

Sonn- und Festtage.

Neujahr. Der 1. Januar.

Sonntag nach Neujahr. Wenn auf den 2. bis 5. Januar ein Sonntag fällt, so ist dieses der Sonntag nach Neujahr.

Epiphanias. Der 6. Januar.

Sonntage nach Epiphanias. Sie werden von Epiphanias an gezählt. Es gibt mindestens einen und höchstens sechs.

Sonntag Septuagesimae.	9	Wochen	oder	63	Tage	vor Ostern.
„ Sexagesimae.	8	„	„	56	„	„ „
„ Estomihi.	7	„	„	49	„	„ „
Aschermittwoch. Der Mittwoch nach Estomihi.				46	„	„ „

1. Sonntag nach Trinitatis.	9	Wochen	oder	63	„	„ „

Die Sonntage nach Trinitatis werden weiter gezählt. Es gibt deren mindestens 22 und höchstens 27.

Herbstquatember. Der Mittwoch, welcher auf den 15. bis 21. September fällt.

Busstag. Mittwoch vor dem letzten Sonntag des Kirchenjahres.

Advents-Sonntage. Es gibt deren vier. Der erste fällt auf den 27. November bis 3. December.

Weihnachtsquatember. Der Mittwoch, welcher auf den 14. bis 20. December fällt.

Weihnachten. Den 25. December.

log Sinus = log Bogen — S
log Tang = log Bogen — T

EINLEITUNG.

I.

Vorbemerkung.

Die vorstehende Tafel verdankt ihre Entstehung dem mehrfach ausgedrückten Wunsche, die Principien, welche bei der sechsstelligen und späteren siebenstelligen Tafel mafsgebend gewesen sind, auch auf eine fünfstellige Tafel in Anwendung gebracht zu sehen. Einer schon vor Jahren gegebenen Zusage konnte im Drange anderer Arbeiten erst jetzt entsprochen werden, und es ist mir eine besondere Genugtuung, das Buch jetzt fertig vor mir zu sehen, da sowohl der eigene Gebrauch die Bedürfnisfrage stets zusagend beantwortete, als auch damit Gelegenheit zur Publikation von einigen anderen längst entworfenen Tafeln gegeben war, welche nun im Anhange beigegeben sind. Bezüglich der inneren Einrichtung von Tafeln gibt es etwas allgemeines, welches in dem bequemen und leichten Gebrauche wurzelt und nie vernachlässigt werden sollte. Wenn jemand beim Anblick einer Leiter von fünfzig Sprossen die fünfundzwanzigste angeben soll, so wird er unwillkürlich nach der Mitte blicken. Ist diese Sprosse dann noch mit einer besonderen Farbe gestrichen, so ist sie zugleich aufgefunden. Das Bild könnte noch weiter ausgeführt werden. Auch wird jeder die Bemerkung gemacht haben, dafs die an sich ungekünstelte Aegyptienne, wie man sie jetzt häufig auf Schildern sieht, bei weitem besser und in gröfserer Entfernung zu lesen ist, als die Schrift mit den schönen römischen Initialen. Diese und ähnliche Betrachtungen, sowie der fünfzigjährige Gebrauch der besten vorhandenen gröfseren und kleineren Tafeln setzten den Verfasser in den Stand, Licht und Schatten zu trennen und gewisse Principien für die Konstruktion von Tafeln als mafsgebend zu erkennen. Es ist derselben bereits in der Einleitung zu der sechsstelligen und siebenstelligen Tafel gedacht worden.

In Bezug auf fünfstellige Tafeln ist zunächst zu bemerken, dafs die so viel verbreiteten und in alle lebende Sprachen übertragenen so beliebten Lalandeschen Tafeln für den Gebrauch höchst unbequem sind. Der trigonometrische Teil ist insofern unrichtig angelegt, als jeder Grad zwei volle Seiten einnimmt und damit abschliefst, wogegen die Logarithmen der Zahlen, die sich dem Format von 30 Zeilen haben fügen müssen, ein unsicheres Umherirren bedingen, welches auf die Dauer ermüdend ist. Die Beliebtheit scheint vorzugsweise durch das kleine Format hervorgerufen zu sein, obgleich ich nicht finde, dafs auf dem Tische des Rechners das Duodez-Format vor einem mäfsigen Octav besondere Vorzüge hätte, das portatif also eigentlich keine Bedeutung hat, da man auf Spaziergängen nicht mit fünfstelligen Logarithmen rechnet. Dieses letztere dürfte eher gelingen mit der hier bei Nicolai erschienenen Tafel in Visitenkarten-Format.

Das kleine Format der Lalandeschen Tafeln finden wir denn auch in neueren Tafeln verlassen, wie in der von Wittstein, Hoüel, Gaufs und anderen; dagegen haben sich neue Mängel eingefunden, welche ihre sonstigen Vorzüge sehr beeinträchtigen. Um dieses kurz anzudeuten, schliefsen bei Wittstein*) sowohl die Logarithmen der Zahlen nicht mit vollen Tausenden auf jeder Seite ab, so dafs hier der Turnus erst auf der 11. Seite wiederkehrt, als auch die Logarithmen der trigonometrischen Funktionen keineswegs mit dem vollen Grade, so dafs erst die je dritte Seite mit derselben Minute anfängt. Dieser Übelstand ist dadurch hervorgerufen, dafs 40 als die Zahl der Zeilen auf jeder Seite angenommen ist, welche Zahl weder in 100, noch in 60 aufgeht. Ferner sind bei den Logarithmen der Zahlen die drei letzten Ziffern abgesondert, wodurch der Übergang der beiden ersten Ziffern zu häufig eintritt. Dieselbe Anordnung des Absonderns von drei Ziffern, statt vier, wie man es bei sechs- und siebenstelligen Tafeln gewöhnt ist, findet sich auch in der Tafel von Gaufs**), wo sonst schon eine mehr systematische Anordnung der Seiten angetroffen wird. Die Trennung der drei letzten Ziffern von den beiden ersten ist einem zu weit gehenden Streben nach Deutlichkeit zuzuschreiben. Die Tafel von Hoüel***), vor einiger Zeit auch mit deutscher Einleitung, vernachlässigt alles, was zur Bequemlichkeit des Auffindens

*) Fünfstellige logarithmisch-trigonometrische Tafeln. Hannover 1865. Hahn'sche Hofbuchhandlung.

***) Fünfstellige Logarithmen. Berlin 1864 bei Ascher.

beitragen könnte. Die Logarithmen der Zahlen sind in Columnen von 60 zu 60 geordnet, weil dieses die Zahl der Sekunden und Minuten ist, die auf die höhere Einheit gehen. Die Proportionaltäfelchen geben, wie alle aus dem vorigen Jahrhundert stammenden Tafeln, nur volle Einheiten. Im trigonometrischen Teile sind die längst für entbehrlich gehaltenen Logarithmen der Sekanten und Cosekanten wieder hinzugefügt, so dafs man glaubt, einen Abdruck von Sherwin vor sich zu haben, in übrigens schöner, von Firmin Didot zuerst bei der Callet'schen Tafel eingeführten Schrift.

Es mag genügen, bei einigen neueren Tafeln, uneingedenk der älteren, die Schattenseiten hervorgehoben zu haben. Um auf das Positive überzugehen, dürfte zunächst die Frage nach dem Inhalt einer fünfstelligen Tafel von Wichtigkeit sein. Nächst dem Bedürfnis des Geometers, den Logarithmen der Zahlen und der trigonometrischen Funktionen Sinus, Cosinus, Tangente und Cotangente, zu welchen auch noch die Additions- und Subtraktions-Logarithmen zu rechnen, begegnet man einer Verschiedenheit von Tafeln, entweder im Interesse des Nautikers, Astronomen, Baumeisters, Ingenieurs, Chemikers, jenachdem der Verfasser diesem oder jenem Fache eine besondere Vorliebe zuwendete. Bei dem geringen Umfang, welchen der logarithmische Teil in Anspruch nimmt, werden manchem solche Zugaben willkommen und für die Wahl der Tafel bestimmend sein. Dagegen ist es völlig wertlos, der Tafel der Logarithmen noch eine der Antilogarithmen hinzuzufügen, da jeder die Erfahrung macht, dafs das Aufsuchen der Zahl, wenn der Logarithmus gegeben ist, sich mit derselben Leichtigkeit vollzieht, wie das Aufsuchen des Logarithmus. Ebenso mufs die nutzlose Zugabe der Sinusversus und Cosinusversus getadelt werden, als dekadische Ergänzung der log cos und log sin, da das Subtrahieren eines Logarithmus nicht mehr Mühe macht als das Addieren. Mit demselben Rechte könnte man auch eine Tafel der dekadischen Ergänzungen der Logarithmen der Zahlen verlangen, was glücklicherweise noch keinem in den Sinn gekommen ist. Eine nutzlose Vermehrung von Tafeln, oder auch nur von Spalten in einer Tafel aber schädigt den Gebrauch derselben. Ferner halten wir eine Tafel der natürlichen Logarithmen für entbehrlich, da niemand damit rechnet. Will man den natürlichen Logarithmus haben, wie es in einzelnen Fällen vorkommen kann, so wird jeder ihn aus dem Briggschen berechnen, welches viel weniger Mühe macht, als das Aufsuchen in einer Tafel, die zum Interpolieren in der Regel nicht eingerichtet ist. Aufserdem werden auch Tafeln der Vielfachen des Moduls und dessen reciproken Wertes gegeben, welche die Verwand-

lung der Logarithmen erleichtern. Am einfachsten ist die Anwendung des Logarithmus des Moduls.

Der erste Teil der Tafel, die Logarithmen der Zahlen enthaltend, ist hier in der Form der sechs- und siebenstelligen Tafeln gegeben. Die Horizontalreihen entsprechen den vollen Zehnern, die Vertikalreihen, in welche die vier letzten Stellen des Logarithmus gesetzt sind, den Einern der gegebenen Zahl, mit dem Unterschiede, dafs hier nur eine Stelle des Logarithmus abgetrennt in die Spalte 0 gesetzt ist, wie dort die ersten zwei und drei Stellen. Abgesehen davon, dafs man durch die sechs- und siebenstellige Tafel an diese Form sich gewöhnt hat, bietet sie den Vorteil, dafs genau 1000 Logarithmen auf jeder Doppelseite des aufgeschlagenen Buches stehen, und der Wechsel der ersten Ziffer zehnmal seltener eintritt, als beim Abtrennen der ersten zwei Ziffern. Es gibt Anhänger der anderen Form, in welcher für jede Zahl der ganze Logarithmus mit seiner Differenz angegeben wird. Sie findet sich vorzugsweise in nautischen Tabellen, auch bei Hoüel, hat aber den Nachteil, dafs bei 250 Zahlen, der besten Abteilung, erst auf der fünften Seite derselbe Eingang wiederkehrt, oder wie bei Hoüel, bei 300 Zahlen, erst auf der elften, ein Nachteil, der bei häufigem Gebrauche sehr lästig wird.

Der zweite Teil enthält die Logarithmen der Sinus, Tangenten, Cotangenten und Cosinus für jedes Hundertstel der Grade des Quadranten. Wir sind hiermit der neuen Richtung gefolgt, welche mit Recht darin eine Erleichterung erstrebt, in jeder Art von Mafs nur eine Einheit zu haben. Die Unbequemlichkeit der bisher üblichen drei Einheiten im Bogenmafs ist längst anerkannt, und wir finden in den meisten fünfstelligen Tafeln nur noch den Grad und die Minute. Ist dann für das Intervall der Minute die Differenz angesetzt, so kann man die Unterabteilungen in Decimalteilen der Minute ausdrücken. Wird aber statt der Differenz der sechzigste Teil derselben angegeben, wie bei Wittstein, so ist man genötigt, auf die dritte Einheit, auf Sekunden überzugehen. In allen Fällen, wo die Länge des Bogens für den Radius 1 verlangt wird, und diese kommen häufig vor, ist man genötigt, die drei Einheiten auf eine zurückzuführen, welches bei unserer Einrichtung wegfällt. Wir wollen indes keineswegs uns anmafsen, zuerst diese Bequemlichkeit eingeführt zu haben. Schon der Erfinder des nach ihm benannten Logarithmensystems, Heinrich Brigg, gibt in seiner Tafel „Trigonometria brittannica, Goudae 1633“ die trigonometrischen Funktionen für jeden Hundertstelgrad des Quadranten. Dieser Fortschritt wurde aber noch in demselben Jahre durch Adrian Vlac wieder rückgängig gemacht durch die von ihm

herausgegebene und von 10 zu 10 Sekunden (ad decades secundorum scrupulorum) fortschreitende Tafel*), um den trigonometrischen Calcul, wie er sich ausdrückt, sicherer und bequemer zu machen (ut calculus trigonometricus certior et facilior redderetur). Diesem sind die späteren Herausgeber von Tafeln gefolgt.

Die durch die französische Revolution zu Ende des vorigen Jahrhunderts eingeführte Einteilung des Quadranten in 100 Teile, für welche die Delambre'schen**) Tafeln und die von Hobert und Ideler***) berechnet sind, findet man noch in verschiedenen Gegenden bei Feldmessern im Gebrauch, in der Astronomie ist sie wieder aufgegeben. Eine systematische Teilung des Kreises kann nur durch eine radikale Beseitigung der alten Einteilung herbeigeführt werden, indem man den ganzen Kreis als Einheit decimal teilt, dann aber auch den Tag, welcher ebensowohl ein Kreis ist, in decimale Teile. Den tausendsten Teil des Kreises könnte man Grad nennen, den zehnten Teil des Tages Stunde. Doch dieses in Vorschlag zu bringen oder gar die ersten Schritte dazu zu tun, gebricht es uns an Mut.

Die Einteilung des Grades in 100 Teile hat für die Tafel noch die Vorteile, dafs bei 50 Zeilen, wie bei den Logarithmen der Zahlen, die zwei Seiten des aufgeschlagenen Buches den Grad vollständig geben und das Intervall kleiner ist, wie für die Minute. Die Differenztäfelchen, welche von 4^0 an für jede Differenz haben Platz finden können, geben nach dem Vorgange der sechsstelligen Tafel†) das Zehntel der Differenz genau, um damit nötigenfalls noch zwei weitere Decimalstellen herzustellen. In der Regel wird man sich mit der dritten Stelle begnügen können. Der Übergang von Bogen auf Sinus und Tangente für die ersten vier Grade wird durch eine besondere Tabelle vermittelt. Andere Hülfsmittel, wie bei Hoüel die natürlichen Sinus und Tangenten, genügen nicht, weil man bei kleinen Bogen nur zwei oder drei bedeutsame Ziffern bekommt, die den fünfstelligen Logarithmus nicht wiedergeben.

Die Tafel der Additions- und Subtraktions-Logarithmen ist konform mit der in der sechsstelligen Tafel††), und da dort die Gründe angegeben sind, welche mich bestimmt haben, von andern abzuweichen, so kann ich darauf verweisen. Die um eine Stelle verminderte Stellen-

*) Trigonometria artificialis, Goudae 1633.

***) Neue trigonometrische Tafeln, Berlin 1799.

†) Logarithmorum VI decimalium nova tabula Berolinensis. Berlin 1852.

††) Logarithmisch-trigonometrische Tafel mit 6 Decimalstellen. Berlin 1869. Nicolai.

zahl erlaubt bei demselben Maximum der Differenzen ein zehnmal gröfseres Intervall, wodurch die Tafel sich auf neun Seiten zusammenzieht. Wollte man nach diesem Princip eine siebenstellige Tafel entwerfen, so würde dieselbe bei gröfserer Bequemlichkeit im Gebrauch, da Argument und Funktion gleichzeitig wachsen und die Differenzen nicht über 620 hinausgehen würden, gegen 814 bei Zech, nur 70 Seiten einnehmen, gegen 200 der Zechschen Tafel.

Hiermit würde der generelle Inhalt, den eine fünfstellige Tafel haben mufs, erschöpft sein. Im Interesse der in neuerer Zeit so vielfach in Anwendung gekommenen Methode der kleinsten Quadratsummen, vorzugsweise in der Physik und Geodäsie, ist indes noch eine Tafel der Quadrate hinzugefügt, speziell für die Bildung der Fehlerquadrate eingerichtet, weil die vorhandenen Tafeln, die nur volle Quadrate geben, hierzu weniger geeignet sind.

In dem Anhange habe ich versucht, einem allgemein gefühlten Bedürfnis, nämlich nach einem Mittel zur Bestimmung der Zeit, durch geeignete Tafeln entgegenzukommen. Die Uhren, sowohl Pendel- als Taschenuhren, sind in den letzten 20 Jahren zu einer grofsen Vollkommenheit gelangt, so dafs die tägliche Abweichung innerhalb weniger Sekunden bleibt, aber leider fehlt es an den meisten Orten, wo nicht grade ein Observatorium zur Zeitbestimmung vorhanden ist, oder der Telegraph die Zeit angibt, an einer richtigen Vergleichung. Das den Tafeln zu Grunde liegende Verfahren ist die Bestimmung des Stunden-Winkels der Sonne, wenn die geographische Breite, die nach einer guten Karte mit hinlänglicher Genauigkeit genommen werden kann, und die Höhe der Sonne gegeben sind. Die letztere bestimmt sich am genauesten mit einem kleinen Theodoliten, Spiegelsextanten oder Universalinstrumente, wie solche bei Baumeistern, Ingenieuren und Feldmessern im Gebrauch sind, und die daraus gefolgerte Zeit hat unter günstigen Umständen nur eine Unsicherheit von wenigen Sekunden. In Ermangelung eines solchen Instruments kann man sich eines Sextanten mit Dioptern bedienen, wie sie hier in optischen Werkstätten für einen mäfsigen Preis sehr sauber angefertigt werden. Da diese letzteren die Höhe der Sonne schon bis auf Bruchteile des Grades sicher angeben, so kann die daraus berechnete Zeit nicht über eine Minute von der Wahrheit abweichen, ein für gewöhnliche Uhren schon sehr wertvolles Resultat. Das Bedürfnis nach einer guten Zeitbestimmung tritt am lebhaftesten auf in Gegenden, die von gröfseren Orten oder Eisenbahn-Stationen entfernt liegen, bei Uhrmachern, Gutsbesitzern, Pächtern und Verwaltungs-Inspektoren. Wenn diese Herren mitunter 100 bis 500 Taler an

eine Ankeruhr wenden, so kann eine weitere Ausgabe von 30 bis 40 Talern für ein Instrument, womit sich die Sonnenhöhe bis auf eine Minute sicher messen läfst, nicht in Betracht kommen. Denn was nützt eine gute Uhr, wenn man kein Mittel in Händen hat, sich ihres Standes und Ganges zu versichern?

Im weiteren Anhang sind einige Seiten der Chronologie gewidmet, einer zwar in die bürgerlichen Verhältnisse tief eingreifenden Wissenschaft, worüber aber selbst bei Gebildeten klare Begriffe selten angetroffen werden. So lange der laufende Kalender ausreicht, kann dieser Auskunft geben, darüber hinaus fehlt es an jedem sicheren Anhalt. Es sind daher auf einigen Seiten die Grundzüge der julianischen und gregorianischen Zeitrechnung nebst einigen Tabellen gegeben, mit deren Hülfe der Kalender eines beliebigen Jahres bis zum Jahre 2200 n. Chr. leicht hergestellt werden kann. Für Fachgenossen bemerke ich, dafs an die Stelle der Sonntags-Buchstaben hier Zahlen gesetzt sind, welche das Datum der Sonntage geben, die Epakten-Rechnung aber durch Einführung von Täfelchen umgangen ist, welche mit Hülfe der güldenen Zahl den Frühlings-Vollmond leicht finden lassen. Erst nach Ablauf dieser Täfelchen, die bis zum Jahre 2200 n. Chr. reichen, wird es nötig, auf die Epakten-Tafel des Lilius zuzückzugehen.

Berlin, im März 1872.

BREMIKER.

Der dritten Auflage dieser Tafeln sind für die Zwecke der Zinseszins- und Rentenrechnung die siebenstelligen Logarithmen der Zahlen von 10000—11000 und der achten Auflage eine Tafel der Werte der trigonometrischen Funktionen für die Zehntel jedes Grades beigegeben worden; der Gebrauch derselben bedarf keiner eingehenden Erläuterung.

II.

Die Briggschen Logarithmen, deren man sich zur Ausführung gröfserer Rechnungen bedient, sind Exponenten der Zahl 10, deren Potenzen die zugehörigen Zahlen bilden. Sind die Exponenten a und b, und ist

$$10^a = A \text{ und } 10^b = B,$$

so sagt man, a ist der Logarithmus von A und b ist der Logarithmus von B. Die Lehre von den Potenzen leitet aus diesen Gleichungen folgende ab:

$$10^{a+b} = AB,\ 10^{a-b} = \frac{A}{B},\ 10^{ac} = A^c,\ 10^{\frac{a}{c}} = \sqrt[c]{A}$$

oder, logarithmisch geschrieben:

$$\log AB = a + b,\ \lg \frac{A}{B} = a - b,\ \log A^c = ac,\ \lg \sqrt[c]{A} = \frac{a}{c},$$

wonach die Logarithmen eines Produktes oder Bruches durch Addition oder Subtraktion, die Logarithmen einer Potenz oder Wurzel durch Multiplikation oder Division der Logarithmen der Grundzahl gefunden werden. Die Anwendung dieser Formen, welche das Rechnen mit Logarithmen ausmacht, wird daher dadurch bedingt, dafs man mit Leichtigkeit zu jeder gegebenen Zahl den zugehörigen Logarithmus finden kann, und ebenso zu jedem Logarithmus die zugehörige Zahl, und dieses zu vermitteln, ist der Zweck der Logarithmentafel.

Aus dieser Erklärung der Logarithmen, welche für den praktischen Rechner genügend und überall mafsgebend ist, folgt nun ferner, dafs

log 1	= 0	lg 0.1	= −1
lg 10	= 1	lg 0.01	= −2
lg 100	= 2	lg 0.001	= −3
lg 1000	= 3	lg 0.0001	= −4
etc.		etc.	

und dieses sind die einzigen Zahlen, deren Logarithmus eine ganze Zahl ist. Von allen übrigen Zahlen besteht der Logarithmus aus einer ganzen Zahl, der Kennziffer oder Charakteristik, und einem Decimalbruch, der Mantisse, und diese letztere ist es, welche durch die Tafel gefunden wird, zu welcher dann die zugehörige Kennziffer, die aus obigem Schema leicht zu entnehmen ist, noch hinzugefügt wird.

Die Logarithmen der Zahlen.

Auf Pag. 2 bis 5 sind für jede Zahl unter 1000 die Logarithmen angegeben. Sie werden nur benutzt, wenn man von verschiedenen Zahlen, die höchstens dreiziffrig sind, die Logarithmen gebraucht, weil man sie dann hier auf vier Seiten zusammengedrängt antrifft. Sonst wäre dieser Teil überflüssig, da diese sämtlichen Logarithmen auch auf den folgenden Seiten zu finden sind. Diesen Logarithmen ist, wie überall, noch die Kennziffer vorzusetzen, nämlich 0 für die Zahlen zwischen 0 und 10, 1 zwischen 10 und 100 und 2 zwischen 100 und 1000. So findet sich der Logarithmus von 574 = 2,75891.

Von Seite 6 bis 23 sind nun die Logarithmen aller mehr als dreiziffrigen Zahlen aufzusuchen. Für jede vierzifferige Zahl ist der Logarithmus unmittelbar angegeben. Die drei ersten Ziffern werden in der mit N überschriebenen Spalte aufgesucht, die vierte Ziffer unter den Kopfzahlen. Da, wo die zu den drei ersten Ziffern gehörige Zeile mit der Spalte der vierten Ziffer zusammentrifft, stehen die vier letzten Ziffern, welche mit der ersten in die Spalte 0 gesetzten Ziffer zusammengelesen den Logarithmus geben. So findet sich auf Seite 7 der log 1856 = 26858, oder wenn noch die Kennziffer der vierstelligen Zahl hinzugefügt wird, = 3,26858.

Hat die vorgelegte Zahl mehr als vier Ziffern, so werden die auf diese folgenden Ziffern als Decimalbruch angesehen. Mit diesem Decimalbruch wird dann die Differenz der Logarithmen multipliciert, und das Produkt zu dem Logarithmus der vierzifferigen Zahl addiert. Wäre 185675 die vorgelegte Zahl, so würde man mit 1856,75 in die Tafel eingehen und die Differenz der Logarithmen, die zu den Zahlen 1856 und 1857 gehören, 23 mit 0,75 multiplicieren. Dieses Produkt ist 17,25, wovon nur die Ganzen benutzt und zu 26858, dem Logarithmus von 1856, addiert werden. Man erhält lg 1856,75 = 3,26875 oder lg 185675 = 5,26875. Um die Multiplikation zu erleichtern, sind für die Differenz 23 in dem zur Seite angebrachten Täfelchen die Zehntel dieser Zahl, also auch die Hundertstel angegeben, welche leicht im Kopfe zusammengezählt werden können, nämlich für das

obige Beispiel 16,1 für 0,7 und 1,15 für 0,05, zusammen 17 mit Weglassung der Bruchteile.

Wenn ein Wechsel der ersten Ziffer der Logarithmen eintritt, so ist dieses auf der ersten der vier letzten Ziffern durch einen Strich angedeutet, um darauf aufmerksam zu machen. So findet sich Pag. 7 lg 1998 = 30060, abgesehen von der Kennziffer.

Der Logarithmus eines echten Bruches ist negativ, weil der Logarithmus des Nenners gröfser ist als der des Zählers. Es ist aber bequemer, mit positiver Mantisse zu rechnen und die Kennziffer negativ hinzuzufügen. Zu dem Ende denkt man sich den vorgelegten Decimalbruch mit einer so hohen Potenz von 10 multipliciert, als der Bruch Stellenzahlen hat, wodurch er eine ganze Zahl wird. Der Logarithmus dieser ganzen Zahl wird dann um den Logarithmus der Potenz von 10 vermindert. Ist gegeben die Zahl 0,0185675, so wird diese $= 185675 : 10^7$ sein. Der Logarithmus des Zählers ist wie oben = 5,26875, wovon der Logarithmus des Nenners = 7 zu subtrahieren ist. Der verlangte Logarithmus wird daher = 5,26875 — 7. Hierfür schreibt man lieber 8,26875 — 10. Abgesehen von dieser subtraktiven 10, die in der Regel nicht geschrieben wird, erhält man die Kennziffer eines Decimalbruches, wenn die Anzahl der auf das Komma folgenden Nullen von 9 abgezogen wird.

Soll zu einem gegebenen Logarithmus die zugehörige Zahl gefunden werden, so suche man zuerst die erste Ziffer der Mantisse in der mit 0 überschriebenen Spalte, alsdann in den mit 0, 1, 2, 3 etc. überschriebenen diejenigen vier letzten Ziffern, welche zunächst kleiner sind, als die des vorgelegten Logarithmus. Hierzu entnimmt man aus der Vertikalcolumne N die auf derselben Zeile stehenden drei ersten Ziffern und die Kopfzahl der betreffenden Vertikalspalte als vierte. Die folgenden Ziffern ergeben sich durch Division der Differenz, welche der gegebene Logarithmus mit dem kleineren der Tafel hat, durch die Differenz der in der Tafel aufeinander folgenden Logarithmen. Ist z. B. der Logarithmns 2,35152 gegeben, so findet man auf Seite 8 den zunächst kleineren Logarithmus 35141, welchem die Zahl 2246 entspricht. Dieser Logarithmus von dem gegebenen abgezogen gibt 11, welche durch die Differenz der Tafellogarithmen, zwischen welchen der gegebene liegt, und die 19 beträgt, zu dividieren ist. Mit Hülfe des Täfelchens für 19 findet man 0,5 für 9,5 und für 11 — 9,5 = 1,5 noch 0,08, welche zu der gefundenen vierzifferigen Zahl hinzugelegt werden. Man erhält 2246,6, wo jedoch das Komma um eine Stelle weiter zur Linken zu rücken ist, da die gegebene Kennziffer 2 ist. Die zu dem Logarithmus 2,35152 gehörige Zahl ist daher 224,66.

In gleicher Weise würde man zu dem gegebenen Logarithmus 7,18520 — 10 die zugehörige Zahl 0,0015318 finden.

Die Logarithmen der trigonometrischen Funktionen.

Von Seite 30 bis 119 sind für jedes Hundertstel der Grade von 0 bis 90 die Logarithmen der Sinus, Tangenten, Cotangenten und Cosinus unmittelbar angegeben. Die aufgeschlagene Doppelseite entspricht hier einem bestimmten Grade. Von 0 bis 44 Grad gilt die Überschrift am Kopfe und der linke Rand, letzterer für die Hundertteile, und von 45 bis 89 Grad die Überschrift am Fuſse und der rechte Rand. Sind die gegebenen Winkel nicht in Graden und decimaler Teilung ausgedrückt, so können die Minuten und Sekunden leicht nach Pag. 28 in Decimalteile des Grades verwandelt werden. Wären z. B. 26′ 10″,3 gegeben, so würde man nach Pag. 28 zunächst 0,43 für 25′ 48″ erhalten, dann für den Rest 22″,3 noch 0,0062, zusammen 0,4362 Grad, eine Operation, die leicht im Kopfe ausführbar ist.

Ist die Tangente von 7,4362° gesucht, so findet man auf Pag. 44 zuerst 9.11531 für 7,43°, wozu noch der Proportionalteil 0,0062 hinzukommt. Die Differenz der Logarithmen ist 59 und das entsprechende Differenztäfelchen giebt 35,4 für 0,006 und 1,18 für 0,0002, zusammen 36,58 oder abgerundet 37, welche zu 11531 addiert werden müssen, weil die Tangenten mit dem Bogen wachsen. Man erhält also 9.11568 als den gesuchten log tang. Da aber die Tangenten unter 45 Grad, sowie alle Sinus und Cosinus echte Brüche sind, so ist hier wie dort noch die negative Kennziffer — 10 hinzuzudenken. Wäre der Cosinus von 58,057° gesucht, so würde man auf Pag. 93 zu 58,05 zunächst 9.72360 finden, von welchem $0{,}7 \times 12 = 8$ abzuziehen, da die Cosinus bei wachsendem Bogen abnehmen, daher 9.72352 = log cos 58,057. Bei kleinen Winkeln, wo die Sinus und Tangenten nicht mehr gleichmäſsig mit dem Bogen wachsen, nimmt man den Logarithmus des Bogens und subtrahiert die auf Seite 170 angegebene Zahl S, wenn der Sinus verlangt wird, oder T, um die Tangente zu erhalten. Wird der Sinus von 0,70153 verlangt, so hat man

lg 0.70153 . . .	9.84605 — 10
S	1.75813
log Sin	8.08792 — 10

Ebenso, wenn die Tangente von 3,0722 verlangt wird,

lg 3.0722 . . .	0.48745
T	1.75771
lg tang	8.72974 — 10

Wird umgekehrt zu dem gegebenen Logarithmus einer trigonometrischen Funktion der zugehörige Bogen verlangt, so geht man von dem nächst kleineren Logarithmus aus, wenn die Funktion mit dem Bogen wächst, oder von dem nächst gröfseren, wenn sie abnimmt, und entnimmt die Ganzen und beiden ersten Decimalstellen der Grade an dem entsprechenden Rande und Kopfe oder Fufse der Tafel. Die folgenden Decimalstellen ergeben sich dann, wenn die Differenz zwischen dem gegebenen und Tafel-Logarithmus durch die ganze Differenz dividiert wird. Es sei der zu log cot = 0,20613 gehörige Bogen gesucht. Auf Pag. 93 findet man 0,20624 als die nächst gröfsere Zahl, welche zu 31,88° gehört. Die Differenz zwischen diesem und dem gegebenen Logarithmus ist 11, welche durch 17, die ganze Differenz, dividiert, mit Hülfe des Täfelchens noch 65 ergiebt. Der gesuchte Bogen ist daher 31,8865°. Ist der Sinus oder die Tangente eines kleinen Bogens gegeben, etwa log tang = 8,26601, so entnimmt man zuerst das dieser Tangente entsprechende T nach Pag. 170, welches, zu der gegebenen Tangente addiert, den Logarithmus des Bogens gibt. Nämlich

log tang	= 8.26601
T Pag. 170 . .	1.75807
log Bogen	0.02408
Bogen	1.05702°

Ist von einem Bogen über 90° der Sinus, Cosinus, die Tangente oder Cotangente zu nehmen, so subtrahiert man von dem gegebenen Bogen das gröfste darin enthaltene Vielfache von 90° und nimmt von dem Überschusse Sinus, Cosinus, Tangente oder Cotangente als die gesuchten, wenn das Vielfache eine gerade Anzahl von Rechten war, oder man nimmt resp. Cosinus, Sinus, Cotangente, Tangente bei einer ungeraden Anzahl von Rechten. Aufserdem ist zu berücksichtigen, dafs der Sinus im 3. und 4. Quadranten negativ ist, der Cosinus im 2. und 3., Tangente und Cotangente im 2. und 4. Diese Verhältnisse sind in nachstehendem Täfelchen, in welchem Z einen Winkel unter 90° bedeutet, so dafs 90 + Z im 2., 180 + Z im 3. und 270 + Z im 4. Quadranten liegt, übersichtlich zusammengestellt.

Bogen	Sinus	Cosinus	Tangente	Cotangente
Z	+ Sin Z	+ Cos Z	+ Tang Z	+ Cotg Z
90 + Z	+ Cos Z	− Sin Z	− Cotg Z	− Tang Z
180 + Z	− Sin Z	− Cos Z	+ Tang Z	+ Cotg Z
270 + Z	− Cos Z	+ Sin Z	− Cotg Z	− Tang Z

Aus diesem Täfelchen ist zugleich zu ersehen, dafs zu jeder gegebenen trigonometrischen Funktion immer zwei Bogen gefunden werden können. Wäre z. B. ein negativer Cosinus gegeben, so würde man denselben entweder in der Rubrik der Sinus aufsuchen und den zugehörigen spitzen Winkel um 90° vermehren, um den gewünschten Bogen zu erhalten, oder in der Columne der Cosinus und zu dem gefundenen spitzen Winkel 180° addieren. Soll über den Quadranten kein Zweifel übrig bleiben, so mufs neben dem gegebenen Logarithmus noch das Zeichen dieser Funktion und zugleich das Zeichen einer andern Funktion, welche beide Funktionen aber nicht Tangente oder Cotangente sein dürfen, bekannt sein. Ist gegeben log tang = 0,17092 und weifs man, dafs die Tangente negativ, der Cosinus aber positiv ist, so wird man dem obigen Täfelchen zufolge den gegebenen Logarithmus in der Spalte der Cotangenten Pag. 98 aufsuchen, daselbst den zugehörigen spitzen Winkel 34,0056° entnehmen und 270° addieren. Der zugehörige Bogen ist daher 304,0056°. Gewöhnlich werden die trigonometrischen Rechnungen so eingerichtet, dafs man zur Bestimmung eines Bogens die Logarithmen zweier Zahlen erhält, die dem Sinus und Cosinus dieses Bogens proportional sind, nebst den Zeichen dieser Zahlen, also die Logarithmen von a . Sin A und a . Cos A, wo a eine beliebige unbekannte Zahl und A den zu suchenden Bogen vorstellt. Die Differenz dieser Logarithmen ist dann log tang A und A liegt im 1. oder 3. Quadranten, wenn die gegebenen Logarithmen beide zu positiven oder beide zu negativen Zahlen gehören, welches letztere gewöhnlich durch ein dem Logarithmus angehängtes n angedeutet wird; oder A liegt im 2. oder 4. Quadranten, wenn die Zeichen der Zahlen resp. plus und minus, oder minus und plus sind. Sobald A gefunden ist, erhält man auch log a, wenn log Sin A von dem ersten der gegebenen Logarithmen, oder log Cos A von dem zweiten subtrahiert wird. Das nachstehende Täfelchen, welches für jede Kombination der Zeichen ein Rechnungs-Beispiel enthält, dient zur näheren Erläuterung.

a Sin A	3.08571	9.50281	1.88391 n	8.11585 n
a Cos A	2.71301	9.67299 n	2.00577 n	7.92103
tang A	0.37270	9.82982 n	9.87814	0.19482 n
A	67.0262	145.9488	217.0650	302.5594
Sin, Cos A	9.96411	9.91831 n	9.90198 n	9.92574
a	3.12160	9.75468	2.10379	8.19011

In den ersten beiden Zeilen stehen die gegebenen Logarithmen von a Sin A und a Cos A, welchen ein n angehängt ist, wenn die zu-

gehörige Zahl negativ ist. Die Differenz dieser Logarithmen, = tg A, steht in der dritten Zeile und hierzu wird der Bogen A aufgesucht. Um log a zu erhalten, braucht man noch Sin A oder Cos A, von welchen der leichteren Interpolation wegen der gröfsere gleichzeitig mit A ausgeschrieben wird. Dieser von dem gröfseren der gegebenen Logarithmen abgezogen, gibt log a. Da die Zeichen ganz auf die Winkelfunktionen geschoben sind, so ist a positiv.

Die Additions- und Subtraktions-Logarithmen.

Diese Tafeln haben den Zweck, den Logarithmus der Summe zweier Zahlen oder den Logarithmus der Differenz zu finden, wenn die Logarithmen der Zahlen gegeben sind. Die Seiten 129 bis 133 sind für Addition bestimmt. Man geht mit der Differenz der Logarithmen, indem der gröfsere von dem um 10 Einheiten vergröfserten kleineren Logarithmus abgezogen wird, welche Differenz mit A bezeichnet ist, in die Tafel ein, entnimmt daraus die Zahl B, welche zum gröfseren Logarithmus addiert den Logarithmus der Summe gibt. Sind 8,75321 — 10 und 0,13109 die gegebenen Logarithmen, so würde der erstere mit log b, der andere mit log a zu bezeichnen sein, man würde 8,75321 für $10 + \lg b$ erhalten und 8,62212 für A. Auf Seite 131 findet sich das zugehörige B = 0,01782, welches zu 0,13109 addiert den $\lg (a + b) = 0{,}14891$ ergibt.

Soll der Logarithmus der Differenz gefunden werden, so geht man wieder mit der Differenz der Logarithmen, jedoch so, dafs der kleinere Logarithmus vom gröfseren abgezogen wird, welche Differenz jetzt mit B bezeichnet wird, in dieselbe Tafel ein, so lange diese Differenz 0,42 nicht übersteigt, und entnimmt die Zahl A, genau so, wie wenn zu einem Logarithmus die Zahl gesucht wird. Dieses A wird dann zu dem kleineren Logarithmus addiert und — 10 hinzugefügt, um den Logarithmus der Differenz a — b zu erhalten. Ist gegeben log a = 3,00175, log b = 2,85417, so stellt sich die Rechnung wie folgt:

lg a	3.00175	
lg b	2.85417	
B	0.14758	
A	9.60711	nach Pag. 133
lg (a — b)	2.46128	= lg b + A — 10.

Ist dagegen die Differenz der gegebenen Logarithmen gröfser als 0,42, so geht man mit derselben, die wieder mit B bezeichnet wird, in die zweite Abteilung Seite 134 bis 138, die nur für Subtraktion gilt, ein und entnimmt das zugehörige C. Dann ist log (a — b) = lg a + C — 10.

Wäre in dem obigen Beispiel für Addition auch der Logarithmus der Differenz gesucht, so würde man haben

lg a	0.13109	
lg b	8.75321 — 10	
B	1.37788	
C	9.98142	nach Pag. 136
lg (a — b)	0.11251 = lg a + C — 10.	

Tafel der Quadrate der Zahlen von 0,000 bis 3,500.

Diese Tafel ist dazu bestimmt, um bei der Anwendung der Methode der kleinsten Quadratsummen mit Leichtigkeit die Summe der Fehler-Quadrate bilden zu können, wobei vorzugsweise die Anwendung in der Geodäsie berücksichtigt ist, wo die übrig bleibenden Fehler in Sekunden mit 3 Decimalstellen ausgedrückt sind, und selten über 3,5 hinausgehen. Hierfür gibt die Tafel die Quadrate unmittelbar bis auf 4 Decimalstellen. So ist das Quadrat von 0,879 = 0,7726 nach Pag. 141. Man kann aber auch über 3,5 hinaus bis zu 35,0 die Quadrate aus der Tafel entnehmen, wenn in der Columne N das Komma um eine Stelle weiter zur Rechten gedacht wird, und gleichzeitig in den Quadraten das Komma um zwei Stellen gerückt wird. Die Quadrate haben dann nur zwei Decimalstellen. So ist nach Pag. 141 das Quadrat von 8,793 = 77,31.

Tafeln zur Bestimmung der Zeit nach Sonnenhöhen.

Diese Tafeln haben den Zweck, um jedermann, der im Besitze einer guten Uhr ist, in den Stand zu setzen, den Gang seiner Uhr zu kontrollieren, unabhängig von anderweiten Vergleichungen. Es ist hierzu eine kleine Rechnung erforderlich, die mit fünf Decimalstellen zu führen ist, und sich so an den Gebrauch einer fünfstelligen Tafel anreiht. In die Rechnung gehen ein die Höhe der Sonne, die Declination der Sonne und die geographische Länge und Breite. Die Höhe der Sonne wird am genauesten mit einem kleinen Theodoliten oder Spiegelsextanten genommen. Ingenieure, Feldmesser, ebenso die Lehrer der Mathematik und Physik, denen solche Instrumente zu Gebote stehen, werden die Höhe der Sonne bis auf ein Sechzigstel oder Hundertstel des Grades damit zu bestimmen vermögen. Auch Uhrmachern ist die Bekanntschaft mit solchen Instrumenten anzuraten, indem sie sich dadurch in den Stand setzen, die Zeit bis auf wenige Sekunden genau zu ermitteln. Für Lehrer sind diese Messungen, die einfach und leicht auszuführen, ein belebendes Mittel für den Unterricht in der Mathematik, sowohl im allgemeinen, als in der Anwendung

der Logarithmen. Den Dilettanten, die, ohne im Besitze solcher besseren Instrumente zu sein, sich mit dieser Methode der Zeitbestimmung befreunden wollen, ist ein Sextant mit Dioptern zu empfehlen, wie solche in optischen Werstätten hierselbst für einen mäfsigen Preis angefertigt werden. Da dieselben die Höhe der Sonne bis auf etwa ein Zehntelgrad genau angeben, so ist eine darauf gegründete Zeitbestimmung, die innerhalb der Minute richtig ist, immer noch ein wertvolles Resultat.

Die in die Rechnung eingehende Länge und Breite sind für den Ort der Beobachtung ein für allemal aus einer guten Karte zu entnehmen. Die Länge ist von Berlin zu rechnen. Gibt die Karte die Länge von Ferro an, so ist solche von 31°, der Länge von Berlin, abzuziehen und mit Hülfe der Tafel Pag. 156 in Decimalteile des Tages zu verwandeln, wodurch man die von Berlin aus gerechnete westliche Länge des Orts erhält. Diese Länge soll mit l bezeichnet werden. Liegt der Ort der Beobachtung östlich von Berlin, so wird l negativ. Die Breite des Orts ist in Graden und Decimalteilen auszudrücken und es genügt, wenn die Hundertteile richtig sind. Auf Seite 148 sind für einige Orte l, die westliche Länge in Decimalteilen des Tages, und φ, die geographische Breite in Graden und deren Decimalteilen, angegeben.

Die Declination der Sonne ist Seite 149 bis 154 für jeden Tag des Jahres angegeben. Sie gilt für den mittleren Mittag eines fingierten Jahres und mufs mit Hülfe der Gröfse k auf das betreffende Jahr reduziert werden. In Schaltjahren, die mit s bezeichnet sind, haben die Tage des Januar und Februar einen besonderen Eingang, um einen Tag von dem in Gemeinjahren verschieden. Ist t die Zeit der Beobachtung, vom Mittage des Tages an gerechnet, vormittags negativ, nachmittags positiv und auf Decimalteile des Tages reduziert, so ist $k + l + t$ das Argument, mit welchem die Declination aus der Tafel zu entnehmen ist. Wäre z. B. am 10. Mai 1872 zu Braunschweig um 9 Uhr vormittags eine Sonnenhöhe genommen, so würde t negativ sein, und da 9 Uhr vom Mittage 3 Stunden entfernt ist, nach Pag. 156, $t = -0{,}125$. Ferner ist nach Pag. 148 für 1872, $k = +0{,}758$, für Braunschweig $l = +0{,}008$, daher $k + l + t = +0{,}641$. Hiermit ist nach Pag. 151 zwischen Mai 10, wo die Declination $+17.567$ ist, nach Mai 11 hin, weil $k + l + t$ positiv ist, zu interpolieren, also die Differenz 0,260 mit 0,641 zu multiplizieren, welches 0,167 gibt, und dieser Betrag zu $+17{,}567$ zu addieren, weil von Mai 10 nach Mai 11 die Declination wächst. Man erhält also für die Zeit der Beobachtung die Declination $= +17{,}734$.

In Betreff der Höhe ist zu bemerken, dafs mittelst eines Theodoliten oder Spiegel-Sextanten nicht die Höhe der Sonne direkt, sondern nur die Höhe des oberen oder unteren Randes beobachtet werden kann. Es mufs daher die beobachtete Höhe noch um den Radius der Sonnenscheibe nach Pag. 155 vermehrt oder vermindert werden, je nachdem der untere oder obere Rand beobachtet ist. Zuvor wird die beobachtete Höhe um den Betrag der Refraktion und Parallaxe berichtigt.

Die mittlere Refraktion ist Pag. 155 angegeben, für geringere Höhen von Zehntel zu Zehntel-Grad, von 15 Grad Höhe an von Grad zu Grad. Kommt es auf grofse Genauigkeit an, so wird diese mittlere Refraktion für Thermometer- und Barometerstand korrigiert, welches dadurch bewirkt wird, dafs man aus den beiden kleinen Täfelchen für den betreffenden Thermometer- und Barometerstand die Korrektion für 0,1 entnimmt, solche zusammenzählt und mit der in Zehntelgraden ausgedrückten mittleren Refraktion multipliziert. Dieser Betrag wird addiert oder subtrahiert, je nachdem das Zeichen der Summe + oder — ist. Wäre z. B. die beobachtete Höhe 12^0, die Temperatur $+ 15^0$, das Barometer $27'' 3'''$, so hätte man die mittlere Refraktion = 0,074. Die Seitentäfelchen geben — 0,004 — 0,002 = — 0,006, welche Zahl mit 0,74 multipliciert = — 0,004 gibt. Die Refraktion ist also = 0,074 — 0,004 = 0,070. Diese Refraktion ist von der beobachteten Höhe zu subtrahieren. Schliefslich wird noch die Parallaxe, welche aus dem dritten Täfelchen unten zu entnehmen ist, addiert. Dieses Täfelchen gibt für 12^0 0,002 und man erhält somit die wahre Höhe des beobachteten Randes = 12,000 — 0,070 + 0,002 = 11,932.

Ist nun t der Stundenwinkel der Sonne, ausgedrückt in Stunden und deren Decimalteilen, also 15.t derselbe Winkel in Graden; ist ferner δ die Declination der Sonne für den Augenblick der Beobachtung, h die Höhe der Sonne und φ die geographische Breite, so hat man

$$\text{Cos } 15.t = \frac{\text{Sin h} - \text{Sin } \varphi \text{ Sin } \delta}{\text{Cos } \varphi \text{ Cos } \delta}$$

Beispiel 1. Es sei

$$h = 37.170^0,\ \delta = + 3.913,\ \varphi = 50.75,$$

so hat man

Sin h	9.78117	Sin φ 9.88896	Cos φ 9.80120
Sin φ Sin δ	8.72301	Sin δ 8.83405	Cos δ 9.99899
diff	1.05816	Sin φ Sin δ 8.72301	9.80019
Pg. 136 C	9.96025		
	9.74142		
Cos φ Cos δ	9.80019		
Cos 15.t	9.94123		
15.t	29.160	t = 1.9427 Stunden	
		= $1^h\ 56^m\ 34^s$.	

Beispiel 2. Es sei 1872 Mai 10 zu Braunschweig mit einem Sextanten die Höhe der Sonne = 39,7 gefunden, die Uhr zeigte $8^h\ 58^m\ 10^s$ vormittags.

Nach Pag. 148 ist k = + 0,758, l = + 0,008, t nach 156 = − 0,126, also k + l + t = + 0,640. Die Declination der Sonne findet sich für Mai 10,641..+ 17.734° und die Zeitgleichung $-3^m\ 49^s$. Die Refraktion, welche nach Pag. 155 ..0,02 ist, könnte hier vernachlässigt werden, da die Höhe nur auf Zehntelgrade genau ist. Die Rechnung stellt sich demnach wie folgt:

h 39.7°	Cos φ 9.78671		Sin h 9.80516
Refr −0.02	Cos δ 9.97886		Sin φ Sin δ 9.38185
39.68	Cos φ Cos δ 9.76557		diff 0.42331
δ + 17.734	Sin φ 9.89812		C 9.79428
φ + 52.270	Sin δ 9.48373		9.59944
	Sin φ Sin δ 9.38185		Cos φ Cos δ 9.76557
			Cos 15 t 9.83387
			15 t 46.989
			t 3.133
			$= 3^h\ 7^m\ 59^s$.

Da vormittags t negativ zu nehmen ist, so erhält man die Sonnenzeit

$$= 12^h - t = 8^h\ 52^m\ 1^s.$$

Die Zeitgleichung war $-3^m\ 49^s$, daher die mittlere Zeit $8^h\ 48^m\ 12^s$. Wird hiermit die Angabe der Uhr $8^h\ 58^m\ 10^s$ verglichen, so zeigt sich, dafs die Uhr um $9^m\ 58^s$ vorging. (Siehe Anm. S. 191.)

Beispiel 3. Vorausgesetzt, dafs zu Neapel am 2. Oktober 1874 nachmittags $2^h\ 50^m\ 5^s$ die Höhe des unteren Sonnenrandes 29.278° beobachtet sei. Thermometer 19.3 R., Barometer 28″ 3‴. Es ist nach Pag. 148 k = + 0,274, l = − 0,002 und nach Pag. 156 t = + 0,118, daher das Argument für die Declination der Sonne und die Zeitgleichung k + l + t = Okt. 2,390. Hiermit erhält man Pag. 153

$$\delta = -3.644 \text{ und die Zeitgleichung } = -10^m\ 42^s.$$

Ferner ist für die Höhe 29° die mittlere Refraktion 0,029. Die Korrektionen wegen Temperatur und Barometerstand sind − 0,006 und + 0,002, zusammen − 0,004, welche Summe mit 0,29 multipliciert − 0,001 gibt. Die Rechnung stellt sich demnach wie folgt:

Höhe des unteren Randes		29.278
Mittlere Refraktion	0.029	
Barometer und Thermometer . .	−0.001	−0.028
Wegen Refraktion verbesserte Höhe . .		= 29.250
Der Radius der Sonne		0.267
Höhe der Sonne h		= 29.517

h =	29.517°	Sin h	9.69257
δ =	− 3.644	Sin φ Sin δ	8.61866 n
φ =	+ 40.834	diff	8.92609 = A
Sin φ	9.81549		0.03517 = B
Sin δ	8.80317 n		9.72774
	8.61866 n	Cos φ Cos δ	9.87799
Cos φ	9.87887	Cos 15 t	9.84975
Cos δ	9.99912	15 t	44.965
	9.87799	t =	2.9977
		=	$2^h\ 59^m\ 52^s$
		Zeitgleichung .	− 10 42
		Mittlere Zeit . .	2 49 10
		Uhrangabe . . .	2. 50 5
		Daher voreilend	0 0 55

In diesem Beispiele mufste zu den Logarithmen von Sin h und Sin φ Sin δ, da letztere Zahl negativ ist, der Logarithmus der Summe gesucht werden, während, so lange δ positiv ist, der Logarithmus der Differenz zu nehmen ist.

Für einen bleibenden Wohnsitz lassen sich die Tafeln bequemer einrichten, weil alsdann φ denselben Wert behält. Setzt man nämlich

$$\frac{1}{\cos\varphi\cos\delta} = m$$

$$\operatorname{tg}\varphi\operatorname{tg}\delta = -n,$$

so hat man

$$\text{Cos } 15\,t = m \text{ Sin } h + n.$$

Berechnet man für jede in der vorigen Tafel angegebene Declination die Werte von log m und log n, so erhält man eine neue Tafel, welche für den bestimmten Parallel, dessen Breite φ in Rechnung gezogen ist, gilt. Beispielsweise ist für die Breite von Berlin, $\varphi =$ 52,505, diese Rechnung durchgeführt. Die Werte von log m und log n sind Pag. 157—162 für jeden Tag angegeben, zwischen welchen ebenso, wie in jener Tafel, mit dem Argument k + l + t interpoliert wird. Die Interpolation von log m macht keine Schwierigkeit, dagegen gehen die Werte von n zur Zeit der Äquinoctien durch 0, deren Logarithmen also durch ∞, so dafs keine Interpolation mehr möglich ist. Für diese Zeichen ist deshalb Pag. 163 noch eine Tafel der natürlichen Zahlen von n gegeben, welche in diesen Fällen zu benutzen ist. Ist daraus n entnommen, so kann leicht der zugehörige lg n aufgeschlagen werden.

Beispiel 1. Den 28. Februar 1872 wurde nachmittags die Sonnenhöhe = 21,14 gefunden. Die Uhr zeigte $2^h\ 45^m\ 35^s$, die Refraktion ist bereits angebracht. Man hat k = + 0,758, l = 0,

$t = +0{,}116$, $k + l + t = +874$. Hiermit erhält man nach Pag. 157 für Febr. 28,874, Datum der Schaltjahre,

lg m	= 0.21993	m Sin h	9.77701
lg n	= 9.26712	n	9.26712
lg Sin h	= 9.55708	A	9.49011
		B	0.11698
		Cos 15 t	9.89399
		15 t	38.427
		t	2.5618
			= 2h 33m 42s
Zeitgleichung Pag. 149			+ 12 50
Mittlere Zeit . . .			2 46 32
Angabe der Uhr			2 45 35
Korrektion der Uhr . . .			+0 0 57

Beispiel 2. Wäre 1887 Sept. 12 vormittags 8h 0m 25s die Sonnenhöhe 21,308 gefunden, bereits für Refraktion, Parallaxe und Halbmesser korrigiert, so hätte man $k = +0{,}124$, $l = 0$, $t = -0{,}167$, $k + l + t = -0{,}043$. Hiermit erhielte man

Pag. 161	Sept 11,957 . .	lg m =	0.21681
„ 163	„ „ . .	n =	− 0.09772
„ 153	Zeitgleichung . .		− 3m 40s

Die Rechnung würde sich daher wie folgt stellen:

lg Sin h	9.56036	15 t	59.938°
lg m	0.21681	t	3.9959
	9.77717		= 3h 59m 45s
lg n	8.98998 n	12 − t =	8 0 15
B	0.78719	Zeitgl. .	− 3 40
C	9.92261	M. Zeit .	7 56 35
Cos 15 t	9.69978	Die Uhrangabe war	8 0 25
		Korrektion der Uhr	− 0 3 50

Es möge genügen, an diesen Beispielen gezeigt zu haben, dafs die Rechnung leicht und einfach ist und von jedem Dilettanten ausgeführt werden kann. Im allgemeinen dürfte noch bemerkt werden, dafs zu kleine Höhen nicht vorteilhaft sind, weil alsdann die Refraktion zu grofs wird und das Resultat unsicher macht. Ebenso sind Höhen kurz vor oder nach Mittag zu vermeiden, weil dann ein kleiner Fehler in der Sonnenhöhe einen grofsen Fehler im Resultat zur Folge hat. Die genauesten Zeitbestimmungen erhält man, wenn die Sonne im Osten oder Westen steht, doch ist dieses nur anwendbar, wenn die Sonne nördliche Declination hat, oder von der Frühlings- bis zur Herbstnachtgleiche.

Anm. Nachdem am 1. April 1893 für Deutschland die mitteleuropäische Zeit d. h. die mittlere Zeit des 15. Längenkreises östlich von Greenwich eingeführt worden ist, sollen unsere Uhren diese Zeit zeigen. Um nun aus der berechneten Ortszeit die mitteleuropäische Zeit zu finden, ist die in Zeit umgewandelte Längenabweichung des Ortes von dem 15. Längenkreise zu ihr zu addieren bezüglich von ihr zu subtrahieren, je nachdem der Ort westlich oder östlich von diesem Längenkreise liegt. Man kann diese Länge aus einer guten Karte entnehmen. Für einige Orte ist auf S. 148 die Länge in Bezug auf Berlin in Decimalteilen des Tages angegeben; um aus dieser Angabe die Längenabweichung des Ortes von dem 15. Längenkreise zu erhalten, hat man die westliche Abweichung Berlins von diesem Kreise nämlich + 0,004 zu addieren.

Tafel zur Berechnung der Höhen nach Barometer-Messungen.

Die von Gaufs eingeführten Tafeln sind wegen ihrer leichten und einfachen Anwendung vor vielen andern vorzuziehen. Der Gebrauch derselben ist am Fufse der Tafel durch ein Beispiel erläutert.

Zeit- und Festrechnung.

Es ist hier der Versuch gemacht, mit Hülfe einiger Täfelchen das Osterfest und die davon abhängenden Feste für ein beliebiges Jahr des julianischen und gregorianischen Kalenders leicht bestimmen zu können. Statt des sonst gebräuchlichen Sonntagsbuchstabens ist das Datum der Sonntage eingeführt. Ferner ist die Epakte durch Täfelchen, welche den cyklischen Frühlings-Vollmond angeben, umgangen. Diese Täfelchen ändern sich im gregorianischen Kalender von Zeit zu Zeit und es sind hier die drei von 1582 bis 2200 geltenden angegeben. Das für den julianischen Kalender angegebene bleibt für alle Zeiten dasselbe. Der Gebrauch ist bei den Täfelchen selbst erläutert.

OF THE UNIVERSITY OF CALIFORNIA

INHALT.

	Pag.
Die Logarithmen der Zahlen von 1 bis 10000	1—23
Verwandlung der natürlichen Logarithmen in gemeine und umgekehrt	24
Siebenstellige Logarithmen der Zahlen 10000—11000	25—27
Verwandlung der Decimalteile des Grades oder der Stunde in Minuten und Sekunden, und umgekehrt	28
Die Logarithmen der trigonometrischen Funktionen	29—119
Die Werte der trigonometrischen Funktionen für die Zehntel jedes Grades	120—128
Additions- und Subtrakttions-Logarithmen	129—134
Subtraktions-Logarithmen	135—138
Tafel der Quadrate der Zahlen von 0,000 bis 3,500	139—146
Tafeln zur Bestimmung der Zeit nach Sonnenhöhen	147—154
Tafeln der Refraktion, Parallaxe und des Radius der Sonne .	155
Verwandlung der Grade, Stunden und Minuten in Decimalteile des Tages	156
Tafeln zur Bestimmung der Zeit nach Sonnenhöhen für den Parallel von Berlin	157—163
Tafel zur Berechnung von Berghöhen nach Barometer-Messungen	164
Zeit- und Festrechnung und chronologische Tafeln	165—168
Beständige Logarithmen	169
Verwandlungs-Logarithmen, um Sinus und Tangenten kleiner Bogen in Bogen zu verwandeln	170
Einleitung	171—191
